Pfizer Statement on Geodon (ziprasidone) Trial Closure in the United States

NEW YORK, November 10, 2020 - Upjohn, a division of Pfizer, has announced the closure of a Phase 3 pediatric clinical trial for Geodon® (ziprasidone). Phase 3 trial A1281198 was a short-term efficacy and safety study of ziprasidone in pediatric subjects (children and adolescents) aged 10-17 with bipolar I disorder (current or most recent episode manic).

Trial A1281198 was designed to fulfill the pediatric study requirement under the Pediatric Research Equity Act (PREA). In agreement with the U.S. Food and Drug Administration (FDA), the study was closed once it reached a sufficient number of participants to establish efficacy and safety objectives in this population.

The primary efficacy endpoint (change from baseline to Week 4 in Young Mania Rating Scale (YMRS) total score) was met, with a statistically significant treatment effect (p=0.005) for ziprasidone when compared to placebo. Treatment with ziprasidone for 4 weeks was safe and generally well tolerated. No new or unexpected safety concerns were observed in the study. Overall, the safety data are consistent with the established safety profile of ziprasidone in adults and with results of previous pediatric studies.

Upjohn is now in the process of filing the results of the study, along with other relevant documentation, to the appropriate regulatory authorities. Upjohn is committed to working closely with regulatory
authorities to determine the impact of these study results on Geodon (ziprasidone) prescribing information.

IMPORTANT SAFETY INFORMATION AND INDICATIONS

WARNING: INCREASED DEATH IN ELDERLY PATIENTS WITH DEMENTIA-RELATED PSYCHOSIS

GEODON is not approved for the treatment of patients with dementia-related psychosis. Elderly patients with dementia-related psychosis (having lost touch with reality due to confusion and memory loss) treated with this type of medicine are at an increased risk of death, compared to sugar pill.

GEODON may increase the risk of changes to your heart rhythm. You should not take GEODON if you have certain kinds of heart conditions that change your heart rhythm, a recent heart attack, heart failure, or take certain medicines known to change heart rhythm. It is important to talk to your doctor about this possible side effect. Call your doctor right away if you faint, pass out, or feel a change in your heartbeat.

It is important to tell your doctor about any other medicines that you take, including non-prescription medicines, supplements, and herbal medicines.

If you experience a high fever, stiff muscles, shaking, confusion, sweating, or increased heart rate or blood pressure, tell your doctor right away. These can be signs of a rare but potentially fatal condition called neuroleptic malignant syndrome (NMS).

Delayed-onset drug reaction called Drug Reaction with Eosinophilia and Systemic Symptoms (DRESS) can occur with ziprasidone. Signs of DRESS may include rash, fever, and swollen lymph nodes. Other severe cutaneous adverse reactions (SCAR), such as Stevens-Johnson syndrome, can occur with ziprasidone. Signs of Stevens-Johnson syndrome may include rash with blisters which could include ulcers in mouth, skin shedding, fever, and
target-like spots in the skin. DRESS and other SCAR are sometimes fatal; therefore, call your health care professional(s) and seek immediate care if you develop any of these signs or symptoms.

If you experience abnormal or uncontrollable facial or body movements, notify your doctor. These could be a sign of tardive dyskinesia (TD), a potentially permanent condition whose risk increases with the length of treatment, but which can also occur after brief periods at low doses.

If you have diabetes or have risk factors or symptoms of diabetes, your blood sugar should be monitored. Symptoms include excessive thirst, urination, appetite, and weakness. High blood sugar has been reported with GEODON and medicines like it. In some cases, extreme high blood sugar can lead to coma or death. Increases in cholesterol and weight gain have also been reported with medicines like GEODON.

Tell your doctor if you are pregnant or intend to become pregnant. Breastfeeding is not recommended.

Antipsychotic drugs (like GEODON) may cause drowsiness, dizziness, or lightheadedness upon standing which could lead to falls, fractures, or other injuries. If you experience these symptoms, tell your doctor.

If you experience a rash or seizures, tell your doctor. Also tell your doctor if you have thoughts of suicide.

Other risks may include decreases in white blood cells (which can be serious), trouble swallowing, high prolactin levels, and impairment in judgment or motor skills. Until you know how GEODON affects you, you should not drive or operate machinery.

Do not drink alcohol while taking GEODON. Avoid becoming overheated or dehydrated.

Common side effects of GEODON include:
• Feeling unusually tired or sleepy
• Nausea or upset stomach
• Constipation
• Dizziness
• Restlessness
• Abnormal muscle movements, including tremor, shuffling, and uncontrolled involuntary movements
• Diarrhea
• Rash
• Increased cough/runny nose

In short-term bipolar mania clinical studies, 4.9% of GEODON-treated patients gained significant weight (7% or more of body weight) vs 3.3% for placebo.

In a long-term bipolar maintenance clinical study, patients who tolerated GEODON plus lithium or valproate (Depakote®) for 10-16 weeks were either continued on GEODON or switched to placebo for up to 6 months. During these six months, 5.6% of patients in both groups gained significant weight. These results do not include patients who did not complete the study.

In short-term schizophrenia clinical studies, 10% of GEODON-treated patients gained significant weight vs 4% for placebo.

Since there is no experience regarding the safety of administering GEODON for Injection to schizophrenic patients already taking oral GEODON, the practice of co-administration is not recommended.

INDICATIONS
GEODON is a type of prescription medicine called a psychotropic, also known as an atypical antipsychotic. GEODON can be used to treat symptoms of schizophrenia and acute manic or mixed episodes associated with bipolar disorder. GEODON can also be used as maintenance treatment of
bipolar disorder when added to lithium or valproate. GEODON may increase the risk of changes to your heart rhythm. In some cases, these types of changes can be fatal though it is unknown whether this is the case with GEODON. It is important to talk to your doctor about this potential side effect, as your doctor may consider a different medicine first.

DISCLOSURE NOTICE: The information contained in this statement is as of November 10, 2020. Pfizer assumes no obligation to update forward-looking statements contained in this release as the result of new information or future events or developments.

This statement contains forward-looking information about Geodon (ziprasidone) that involves substantial risks and uncertainties that could cause actual results to differ materially from those expressed or implied by such statements. Risks and uncertainties include, among other things, the uncertainties inherent in research and development, including the ability to meet anticipated clinical endpoints, commencement and/or completion dates for our clinical trials, regulatory submission dates, regulatory approval dates and/or launch dates, as well as the possibility of unfavorable new clinical data and further analyses of existing clinical data; the risk that clinical trial data are subject to differing interpretations and assessments by regulatory authorities; whether regulatory authorities will be satisfied with the design of and results from our clinical studies; uncertainties regarding the commercial success of Geodon; decisions by regulatory authorities impacting labeling, manufacturing processes, safety and/or other matters that could affect the availability or commercial potential of Geodon; uncertainties regarding the impact of COVID-19 on our business, operations and financial results; and competitive developments.

A further description of risks and uncertainties can be found in Pfizer’s Annual Report on Form 10-K for the fiscal year ended December 31, 2019 and in its subsequent reports on Form 10-Q, including in the sections
thereof captioned “Risk Factors” and “Forward-Looking Information and Factors That May Affect Future Results”, as well as in its subsequent reports on Form 8-K, all of which are filed with the U.S. Securities and Exchange Commission and available at www.sec.gov and www.pfizer.com.
